

*GY-HM200/250/170/180 4KCAM: I am having trouble with color fluctuating.*

*I noticed while color grading that every few minutes the color will change and a minute or two later revert back. I am filming against green screen.*

When HM2x0 series is in the Full Auto mode, it is possible that the WB would drift especially if light source is LED with adjustable color temperature.

To avoid this, set the white balance manually using WHT BAL A. Then set MENU › CAMERA FUNCTION › FAW › A.
